

# DOSO

## High performance

### Driving concepts

Our DOSOMAT machines offer various flexible driving concepts and are effective through their modular design.

The basic version is driven by a main motor, the power being transmitted through control gears and large-dimensioned gear wheels to the different stations, and to the indexing gear.

Due to the modular design, any station can be provided, if desired, with a servo-motor. This means that all machine movements can be perfectly adjusted to the individual product.

### Control systems

The control cabinet in stainless steel can be stand-alone, or pivot-mounted on the machine and is suitable for operation in wet rooms. Control is by free-programmable PLC, modem, clear plain text display with key pad or touch-screen. Compressed air control is in the most modern design with low maintenance valve blocks and automatic limit value control.
